

(Transcript) Send Report via Email Notification

In this session, we are going to look at how TestProject allows reports to get sent directly to our email.

We need a job before starting the process. Add a new job. Select Web then Next. Enter Name of Job as Email Notification, Description is not required, Select Next, Edge browser. If you wanted to, you can also create and schedule a job. Click Create. Drag Complete Test Form to the job.

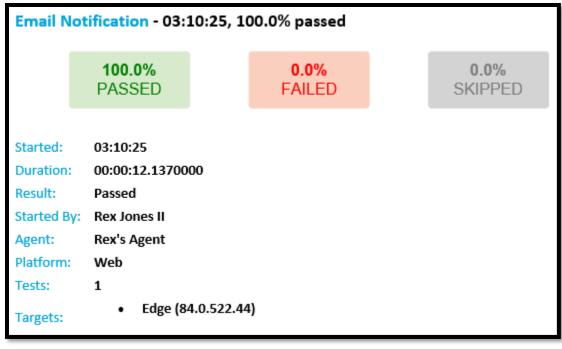

Now, we click this email icon and select our Job Notifications Preferences. The email can get sent when the Job start, when the Job finish, Always send a notification, or Only send notification on a Failure. At this point, we enter the email address Rex.Jones@Test4Success.org then click Save.

You see these other jobs also have an email icon. We can email a report for new or existing jobs. Last step is to run the job. Job Execution has started. Now, we are waiting for the Email Notification. Soon as this job finish.

There it is. This email let's us know the job has started. It shows the time, who started the job, Agent, number of Test, and Edge browser. This other email came through and it also provide who started, Agent, Platform, Edge Browser. It shows the Success Ratio 100% Passed. Let's look at the Full Report by clicking the button. It takes us back to the TestProject Platform. Success Ratio 100%. Let's look at the Full Report in the PDF Form. We see everything: Job Report, Overall Summary, Test Results, and Detailed Report with the steps.

That's it for sending out a report using an email notification and Thank You for this TestProject series.
